C S A P

COMMON SECURITY ARCHITECTURE
for PRODUCTION

PART 2:

INTERFACES

VERSION 1.2

Contents

1   Introduction

This document is Part 2 of the group of documents that describe our security architecture. Part 1 is the overall architecture description, and familiarity with that document is necessary to understand this document.

This document illustrates the interfaces between:

- Core components and supporting components
- Core components and production management
- Between core components

It uses a canonical form as a means of explanation; however, this is not intended to be a specification for APIs.

Changes from CSAP Part 1 v1.1

- The name of the *authorization policies* has been changed to *authorization rules*.
- The functions of the policy manager moved into the authorization service, the policy service in v1.0 now consists only of the Authorization Rules Distribution Service (ARDS), formerly called the policy engine. This does not change the functions necessary to create an authorization policy, but consolidation simplifies this part of the architecture.

2   Component Interfaces

Interactions between components are classified according to four types.

Figure 2-1 Types of interactions between components

1. *Directs* – a message is sent from one component to another, and the receiving component is required to act on the message.
2. *Requests* – a message is sent from one component to another requesting information, e.g., the requester is registering with a service to receive alerts.
3. *Alerts* – an urgent notification, likely an asynchronous message, is sent from one component to another notifying the receiving component of a material change of state. The expectation is that the receiving component will act on the alert.
4. *Informs* – a notification, likely an asynchronous message, is sent from one component to another notifying the receiving component of current state or change in state.

Alerts are distinguished from *informs* since a different mechanism might be used to deliver urgent messages. However, the mechanism for transmitting messages is beyond the scope of this architecture.

In the rest of the document, the interactions of components are listed in the format:

Component A interaction **component B**

- Parameters: <a list of parameters sent with the interaction>
- Returns: <a list of values returned to the sending component>

Lists of parameters and returned values shown in this document are not necessarily complete.

2.1   Parameters

The parameters used in the architecture are:

Identifier: the value used to identify the entity (something that is taking part in the workflow: e.g., asset, resource, human).

Credentials: data providing evidence for claims about the identity.

Contextual Attributes: data describing characteristics of the contextual attributes of an authentication request. That might include:

- IP address
- Geolocation
- System
- Previous times the entity has been authenticated
- Production

Trust Score: the trust score is a number assigned by the trust inference and continuous trust validation indicating the level of trust appropriate for an artifact. We might use a trust score that is in the range of 1 to 100 where:

- A trust score of 100 represents the highest confidence that an entity is the trusted entity it claims to be, if continuous trust validation confirms that score then the lifetime of a previous authentication can be extended.
- A trust score of 0 means the entity is not, or must not be regarded as being, the trusted entity it claims to be.

Access Token: an access token contains the security credentials of an authenticated entity.

Permissions List: a set of permissions that control the ability of an entity to read, write, change, and execute an asset or application.

Security Status Request: a security status is requested for a listed set of artifacts.

Security Status: the security status of the artifacts in the security status request.

Alert Code: a context specific code describing the reason for the alert.

2.2   Document Organization

The document is organized around the core and supporting security components. Interfaces are listed under the initiating component.

2.3   Abbreviations

ARDS - Authorization rules distribution service.

PEP - Policy enforcement point.

# 3   Supporting Security Component Interfaces

Figure 3-1 Supporting security components

3.1   Identity Management

Identity management alerts ***authentication service***

- Parameters: identifier, reason code

If the identity management is an IAM system:

Identity management notifies ***authorization service***

- Parameters: identifier, permissions list or NULL

3.2   Trust Inference

Trust inference informs ***authentication service***

- Parameters: identifier, trust score

3.3   Continuous Trust Validation

Continuous trust validation alerts ***authentication service***

- Parameters: identifier, trust score

Continuous trust validation informs ***authentication service***

- Parameters: identifier, trust score

3.4 Certificate Service

3.4.1 Interface Parameters

Certificate service alerts ***authentication service***

- Parameters: Authentication certificate, REVOKED

Certificate service alerts ***asset protection service***

- Parameters: Authentication certificate, REVOKED

3.5 Continuous Monitoring and Security Operations

Continuous monitoring and security operations alerts ***authorization service***

- Parameters: set of resources, security status of resources

Continuous monitoring and security operations informs ***authorization service***

- Parameters: set of resources, security status of resources

Continuous monitoring and security operations alerts ***authentication service***

- Parameters: identifier, security status

Continuous monitoring and security operations informs ***authentication service***

- Parameters: identifier, security status

Continuous monitoring and security operations alerts ***asset protection service***

- Parameters: asset identifier, asset location, security status

3.6 Threat Analysis and Intelligence

Threat analysis and intelligence informs ***authorization service***

- Parameters: set of resources, security status of resources

Threat analysis and intelligence alerts ***authorization service***

- Parameters: set of resources, security status of resources
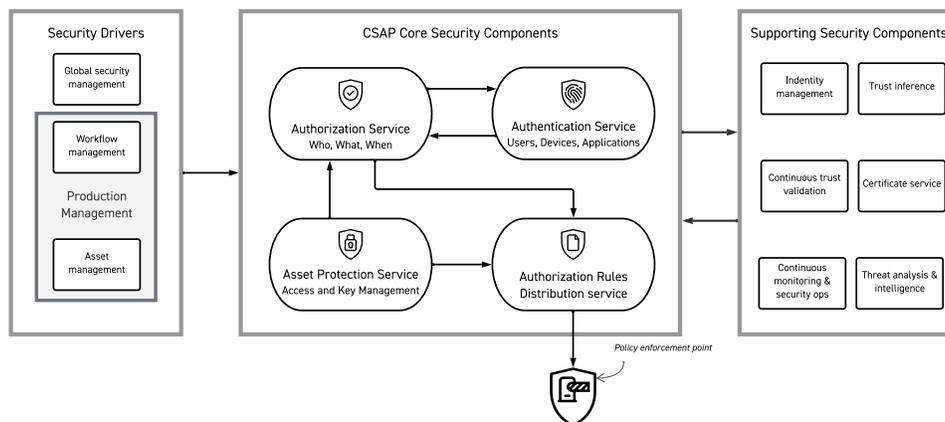

4 Core Security Component Interfaces

Figure 4-1 Detail of core components

4.1 Authentication Service

Authentication service directs ***identity management***

- Parameters: identifier, credentials, context attributes
- Returns: access token, FAIL

Authentication service requests ***trust inference***

- Parameters: identifier
- Returns: trust score

Authentication service requests ***continuous trust validation***

- Parameters: identifier, trust score
- Returns: trust score

Authentication service directs ***certificate***

- Parameters: identifier, public key
- Returns: authentication certificate

Authentication service alerts ***authorization***

- Parameters: identifier, alert code

Authentication service alerts ***production management***

- Parameters: identifier, alert code

Authentication service alerts ***ARDS***

- Parameters: identifier, alert code

The alert code describes the reason for the alert, such as an authentication policy has been revoked.

4.2 Authorization Service

Authorization service directs ***authentication service***

- Parameters: identifier
- Returns: access token, FALSE

Authorization service directs ***ARDS***

- Parameters: authorization rules

Authorization service alerts ***ARDS***

- Parameters: authorization rules, change reason code

Authorization service directs ***asset protection service***

- Parameters: asset handle
- Returns: SUCCESS, FAIL, error code

Authorization service alerts ***production management***

- Parameters: identifier list, asset handle list, alert code

Authentication service requests ***continuous monitoring and security operations***

- Parameters: set of resources
- Returns: security status of resources

Authentication service requests ***threat analysis and intelligence***

- Parameters: set of resources

If the identity management is an IAM system:

Authorization service requests ***identity management***

- Parameters: identifier
- Returns: permissions list, NULL

4.3 Asset Protection Service

The asset protection service is supplied with:

Asset protection service requests ***authentication service***

- Parameters: identifier
- Returns: TRUE, FALSE

Asset protection service directs ***certificate service***

- Parameters: identifier, public key

- Returns: certificate

Asset protection service directs ***policy enforcement point***

- Parameters: identifier, access permissions, encryption keys
- Returns: ACK, ERROR

4.4   ARDS

ARDS requests ***asset protection service***

- Parameters: asset handle, asset location
- Returns: SUCCESS, FAIL, error code

ARDS directs ***policy enforcement point***

- Parameters: authorization rule(s)
- Returns: security status of resources

4.5   Policy Enforcement Point

Policy enforcement point alerts ***ARDS***

- Parameters: exception

5   Production Management Interfaces

Workflow management directs ***authentication service***

- Parameters: Identifier
- Returns: ACK, ERROR

Workflow Management directs ***authorization service***

- Parameters: Resource list, participant list, asset list
- Returns: ACK, ERROR

Asset management directs ***asset protection service***

- Parameters: Asset handle, asset location
- Returns: ACK, ERROR
